ASSIGNMENT
MACHINE LEARNING

- Your task is to train a NLP model for a resume parser.
- Your model should be able to take a resume file as input and extract its content.
- The final output should be a JSON with resume headings as its keys and their content as values.
- Each resume has its unique style of formatting, has its own data blocks, and has many forms of data formatting, but the final structure of JSON should be fixed for any type of resume and your model should be able to support as many resume templates/styles as possible.

You can use any online available dataset or even scrape websites to build your own dataset.
